

The **courage** to strive for what seems out of reach.

The **resilience** to learn from failure and keep moving forward.

The **hope** that inspires us every step along the way.

Deep within the biology of the brain is a set of **intricate instructions that define who we are** – how we move, how we think, our very sense of self.

Sometimes these instructions fail. Our body becomes unable to read or respond to the signals, or something in the code itself goes wrong.

When the errors reach deep into the brain, our **complex neurology** and **natural defenses** make repairing them all the more challenging.

Neuroscience is the next frontier.
The risk of failure keeps others away. But at Biogen, we are not afraid to go where others won't.

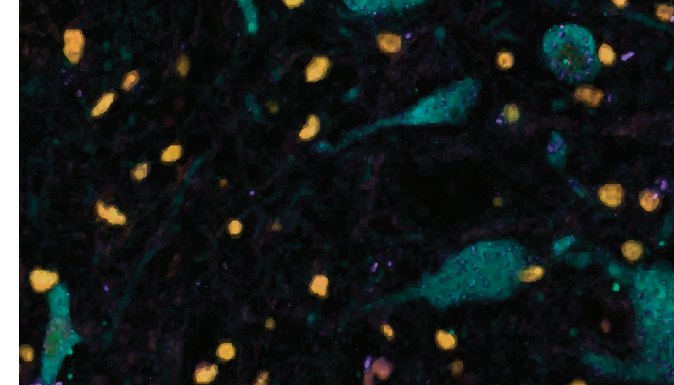

Not because we can, but because we must.

where
science
meets **humanity**™

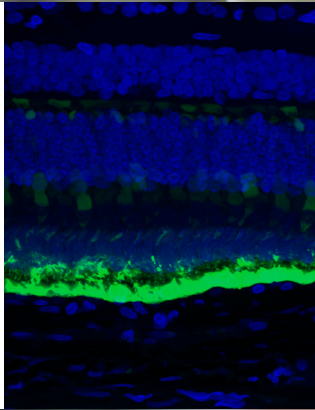

At Biogen, we are **pioneering new science** that takes us deep into the body's nervous system, and stretches wide across digital networks and patient communities, **to better understand, and preserve, the underlying qualities of our essential human nature.**

Science that transforms patient lives by **improving mobility, breathing, vision and brain health.**

Science that seeks to **solve societal problems and create access to innovation.**

Science that acts with purpose to address the urgent and long-term **challenges facing humankind.**

Science that is **inspired by the diversity and passion of our people.**

Courage, resilience, hope.
These are the qualities we seek to preserve.
They are also the qualities that drive us to preserve them.
